In the specification:

Please replace paragraph 58 with the following paragraph:

Hepatic lipase was measured after subjects (who had fasted overnight) were given an intravenous bolus infusion of 60 units heparin per kg body weight. Fifteen minutes later, the post-heparin sample was drawn into tubes containing EDTA on ice, the plasma promptly separated, aprotinin added, and the sample rapidly frozen at -70°C. Lipase activity was assayed using [³H]triolein-labeled Triton TRITION X-100TM emulsion as described previously, with the addition of 1 mol/L NaCl.
